

# DECORATIVE AGGREGATES

Clear the required area, removing all loose material and vegetation (use weedkiller if necessary on any deep-rooted weeds). Lay a semi permeable membrane over the whole area, with a minimum of 50mm overlap between sheets. Lay the decorative aggregate to the required depth (40mm is sufficient for most applications but check the packaging for any instructions specific to your product). Rake to achieve the required surface level. Although decorative aggregates can be laid directly onto soil it is recommended to use a membrane to minimise weed growth.
